## 1 Introduction

`expex-acro`, as the name suggests, combines the `expex` (for typesetting linguistic examples) and `acro` (for acronyms) packages. It provides commands for the following functionalities: referring to examples (Section 2), registering and using glossing abbreviations (Section 3), and common notations in linguistics (Section 4). For detailed instructions, refer to the respective documentations of `expex` and `acro`.

Below is a multipart example typeset using `expex` and the `\gl{}` command. Note that it uses two distinct labeling mechanisms, the native `expex` `<tag>` notation, and the `LATEX` `\label{tag}` notation. Usually, you would use only one of the two in your examples.

---

<sup>\*</sup>This document corresponds to `expex-acro` v0.0.2, dated 2022/05/17.

- (1) a. Bernese German  
*üsne Vättere*  
 üs-ne vätter-e  
 our-DAT.PL father.PL-DAT.PL  
 ‘to our fathers’
- b. Latin  
*insularum*  
 insul-arum  
 island-GEN;PL  
 ‘of the islands’

```

1 \pex<ex1> \label{ex:1}
2 \a<bernese> \label{ex:bernese}
3 \begingl
4 \glpreamble Bernese German//
5 \glpreamble \obj{üsne Vättere}//
6 \gla üs-ne vätter-e//
7 \glb our-\gl{dat}. \gl{pl} father
  .\gl{pl}-\gl{dat}. \gl{pl}//
8 \glft \qu{to our fathers}//
9 \endgl
10 \a<latin> \label{ex:latin}
11 \begingl
12 \glpreamble Latin//
13 \glpreamble \obj{insularum}//
14 \gla insul-arum //
15 \glb island-\gl{gen}; \gl{pl}//
16 \glft \qu{of the islands}//
17 \endgl
18 \xe

```

## 2 Referring to examples

**\exref** The `\exref` command can be used to refer to examples in text. The package option `refmode` determines how `\exref` will behave: To use the built-in tag system (default):

```
\usepackage[refmode=expex]{expex-acro}
```

To use L<sup>A</sup>T<sub>E</sub>X `\label`s:

```
\usepackage[refmode=latex]{expex-acro}
```

### 2.1 Using native expex tags

expex has its own tag system, e.g. `<ex1>` in (1) above. The corresponding usage is `\exref[<id1>]{<id2>}`. Note that when using the expex mechanism, subexamples need to be referred to by their `\pex`'s tag and a period:

(1), (1a), and (1b).

```
1 \exref{ex1}, \exref{ex1.bernese},
and \exref{ex1.latin}.
```

If an optional argument is given, `\exref` will assume that these are two examples in a range:

(1a–b)

```
1 \exref[ex1.bernese]{ex1.latin}
```

### 2.2 Using L<sup>A</sup>T<sub>E</sub>X labels

The alternative is to use the usual L<sup>A</sup>T<sub>E</sub>X `\label` commands in your examples, like `\label{ex:1}` in (1) above. The corresponding usage is `\exref[<range>]{<id>}`. In this mode, one can directly refer to subexamples:

(1), (1a), and (1b).

```
1 \exref{ex:1}, \exref{ex:bernese},
and \exref{ex:latin}.
```

The optional argument is simply inserted after the mandatory argument; ranges of subexamples can be done this way.

```
(1a–b)
```

```
1 \exref[a--b]{ex:1}
```

## 3 Glossing abbreviations

`expex-acro` loads the `acro` package for defining glossing abbreviations, displaying them in running text, and printing a list of the ones used.

### 3.1 Package options

`abbrevs` By default, `expex-acro` loads no pre-defined glossing abbreviations. This can be changed by using either

```
\usepackage[abrevs=leipzig]{expex-acro}
```

or

```
\usepackage[abrevs=all]{expex-acro}
```

Note that the current version of `acro` becomes significantly slower when loading long abbreviation lists (<https://github.com/cgnieder/acro/issues/205>). Thus, there is a trade-off between having to manually define every glossing abbreviation you use, and speed.

### 3.2 Commands

`\newGlossingAbbrev` Define a new glossing abbreviation. Usage: `\newGlossingAbbrev{<key>}{{<meaning>}}`.

Example: `\newGlossingAbbrev{occ}{occultive}`.

`\gl` Render a glossing abbreviation. Usage: `\gl{<key>}`. Example: `\gl{occ}`.

`\glossingAbbrevsList` Print list of used glossing abbreviations. Usage: `\glossingAbbrevsList`. Demo:

```
DAT dative
```

```
GEN genitive
```

```
PL plural
```

```
1 \glossingAbbrevsList
```

## 4 Semantic commands for linguistic texts

An oft-cited advantage of using L<sup>A</sup>T<sub>E</sub>X is the separation of content and formatting. That principle is broken by using things like `\textit` for object language. Of course, italics are a wide-spread standard, but what if you need or want to change how object language is displayed for some reason? Apart from `\gl` for glosses, the following commands are built into `expex-acro`:

1. *xats* (object language)
2. ‘cat’ (free translation)
3. \**katta* (reconstructed form)
4. ⟨Chatz⟩ (orthographic representation)
5. CHATZ (lexeme)

```

1 \begin{enumerate}
2 \item \obj{xats} (object language
3 )
4 \item \qu{cat} (free translation)
5 \item \rc{katta} (reconstructed
6 form)
7 \item \ort{Chatz} (orthographic
8 representation)
9 \item \lxm{chatz} (lexeme)
10
11 \end{enumerate}

```

## 5 Implementation

```
